COASTAL ENGINEERING
RESEARCH CENTER

ABSTRACT

A groin is a shore protective structure built (usually perpendicular to the shore) to trap littoral drift or to retard erosion of the shore. Considering all types of shore protective structures used by coastal engineers, the groin is one of the most controversial and most difficult to design. Because the functional and structural guidelines for design are incomplete, many groin installations fail to fulfill their intended purpose. CERC supports a continuing research program devoted to gaining a better understanding of groins. This bibliography evolved from the groin research program.

About 460 articles published since 1900 on groins and groin-type structures are presented in this bibliography. Annotations accompany each bibliographic entry where possible. Indexes of authors, titles, and subjects are included to aid the researcher. Unavailable literature such as foreign articles, although not annotated, are included as entries in both the annotated section and the indexes.

FOREWORD

This bibliography was compiled by J. H. Balsillie and R. O. Bruno under the general supervision of D. W. Berg, Chief, Evaluation Branch, and G. M. Watts, Chief, Engineering Development Division.

Indexes of the bibliography were automated by the use of a computer. Programs used were prepared by M. Keplinger of the National Bureau of Standards and B. R. Sims of the Coastal Engineering Research Center. Mr. Sims adapted these programs specifically for the compilation of this bibliography.

At the time of publication, Lieutenant Colonel Don S. McCoy was Director of CERC; Thorndike Saville, Jr. was Technical Director.

NOTE: Comments on this bibliography are invited. Readers who find omissions or errors are urged to submit their suggestions.

This report is published under authority of Public Law 166, 79th Congress, approved July 31, 1945, as supplemented by Public Law 172, 88th Congress, approved November 7, 1963.

INTRODUCTION

Groins are shore protection structures, usually built perpendicular to the shore, that function to trap littoral drift or retard erosion of the shore. This annotated bibliography is intended to provide a ready source of published information on groins and groin-like structures.

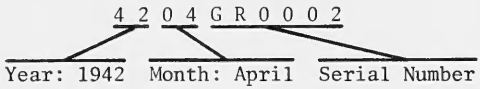
The Coastal Engineering Research Center (CERC) and its predecessor, the Beach Erosion Board, have for many years been investigating groins both in the field and laboratory. During the past several years, the emphasis placed on investigation of groins has increased. As a result, a study is now underway to determine functional and structural behavior of groins to improve guidelines and criteria for use in their design.

As part of this investigation, the available literature was reviewed. It became apparent that the results of this review would assist others; thus, this bibliography has been compiled and published.

463 articles, published since 1900, on groins and groin-like structures are referenced by this bibliography. Appropriate annotations are provided to assist the investigator. Additionally, cross-referenced indexes for author, title, and subject have been included to facilitate access to the annotated section.

USE OF BIBLIOGRAPHY

Each entry of the bibliography consists of a code number, title, author, source, annotation, and key word list. These entries appear in consecutive order of code numbers, the code number depending in part upon the year and month of publication, as:



Where the year or month of publication cannot be determined zeros are substituted.

For articles or reports which have been published the appropriate citation is given. At the end of the source citation, call numbers of those entries held in the CERC Library appear in parentheses.

Annotations are an integral part of this compilation. Even so, many articles, such as foreign and domestic articles that were unavailable to the authors or untranslated foreign articles have not been annotated. In some cases, the titles of foreign articles, have been translated to indicate the content of the article. U. S. Congress House Documents have not been annotated because of their similarity of

text, large number, and easy availability. All of this literature, however, is referenced in the annotated bibliography in correct sequence, and in the indexes under the appropriate headings. Notation for articles not annotated which appear in the indexes is as follows:

NA - BEACH EROSION AT SANTA BARBARA CALIFORNIA 3803GR0001

Special utility of the bibliography lies in its indexes. The author index is an alphabetical listing; the title index is an alphabetical listing of words taken out of context of the titles. To provide a subject index, key words were chosen; all articles were keyed to this listing. Before using the subject index the researcher should refer to the key-word list (page 199) to choose the subjects of interest.

In most cases the meanings of the key words are straightforward. However, to clarify any confusion that may result, a list of definitions for the key words follows the key word list (page 200).

"One Aspect of the Dynamics of a Coast Partly Protected by a Row of Groynes" 0000GR0001
Bakker, W. T., Unpublished Manuscript.
(TC337 .B168)

A mathematical theory is given about phenomena caused by groin construction. Onshore and offshore transport are considered, but not the influence of wave refraction and diffraction. Effects of groins found in this study are: (1) in the middle of the protected part of the coast the same processes occur as without groins, but slower; (2) there are edge effects at the ends of a system where much more accretion and erosion occur than without groins; and (3) the rate of effect of the system depends upon the spacing of the groins.

Key Words - Theory/Erosion/Accretion/System/Transport-normal/

"The Coastal Dynamics of Sand Waves and the Influence of Breakwaters and Groynes" 0000GR0002
Bakker, W. T., Unpublished Manuscript.
pp. 1-7. (V.F. 3249-a BAK)

At a coastline where littoral transport by waves prevails, progressive sand waves can exist, if there is a periodical varying disturbance at one point on the coast and the coastline is at rest at more than half a wavelength distance. These sand waves (or megaripples) move from the point of disturbance to the part of the coastline that is at rest, independent of the direction of the littoral transport. Wavelength increases with the period, but the velocity of propagation decreases. A groin reflects a part of the sand wave. The amplitude of the sand wave near the groin on the side of the disturbance increases; a decrease occurs on the other side of the groin.

Key Words - Theory/Impermeable/Erosion/Accretion/

"Influence of Protective Works on the Erosion of the West Coast of Sylt, North Sea Coast of Germany" 0000GR0003
Fischer, O., Translation, 12 pp. (TC273 .F9)

Measurements of the beach on the west coast of Sylt showed that groins and other existing protective structures were independent of subsequent successions of accretion and erosion. The author proposes that original studies maintained over a short period of time were applied to a long period and did not constitute a proper basis for conclusions for beach protection.

"The Protection and Improvement of Foreshores by the Utilization of Tidal and Wave Action" 0306GR0001
Allanson-Winn, R. G., Transactions of the American Society of Civil Engineers, Vol. 50, June, 1903, pp. 66-94

Case groins, constructed of timber, with a long, low design, and economical to build are discussed relative to groins of other designs. A field study is presented in favor of Case groins where the author states that an analogy of small obstructions (Case groins) and the multiplication of small results gradually brings about desired beach buildup.

"Coney Island Public Beach and Boardwalk Improvement" 2300GR0001
Farley, P. P., The Municipal Engineers Journal, Fourth Quarterly Issue, 1923, 32 pp. (TC345 .N73F2)

As part of the Coney Island Improvement project during the early 1920's a system of high impermeable groins was constructed. The groins were not designed to accumulate sand but rather to retain the sand which was pumped between them, to reduce scour by confining the sand between the high barriers, and to break up the sea in time of storm.

Coen-Cagli, M. E., World Ports, American
Shore and Beach Preservation Association,
Vol. 20, No. 4, Feb., 1932, pp. 286-293

The design and method of construction of groins for the protection of sand and pebble beaches must be preceded by a careful study of the locality and all forces acting on the coast. Groin height, length, the terminal groin, and groin spacing are considered.

Key Words - Misc-plan/Structural-design/Accretion/Erosion/Terminal/ Single/System/Timber/Impermeable/1900-1949/

"Du-Plat-Taylor Adjustable Screw Pile Groynes" 3306GR0001
Anonymous, The Engineer, London, June, 1933,
4 pp. (TC257 .B1 3)

An adjustable screw pile groin was developed in England. The screw piles, 8 to 10 feet long, are tubular with iron screws cast on to them. The planks are held to the piles by retaining collars.

Slotted arrangement of bolt holes allows the planks to assume a considerable angle with the horizontal in the vertical plane. Advantages of these groins are cheapness, rapidity of construction, and facility of adjustment.

(TC345'.G7D65)

Usually a silent topic, the author presents a discussion on the terminal groin of a system. Until a solution is devised that eill end the scour of the terminal groin, it is suggested that permeable lateral works, wave screens, faggoting, and groins (as low as possible) be employed to keep erosion at a minimum. Faggot-work groins, used to reduce irregularities caused by groins in shingle banks, are given special attention.

Frech, F. F., U. S. Army Corps of Engineers, Philadelphia District, June, 1948, 35 pp., Unpublished Report. (TC330 .Fr48)

Shore protective structures, including groins, along the New Jersey coast are discussed and evaluated. New designs are offered where shore conditions warrant special structures.

Key Words - N. Atlantic/Field/Piling/Timber/Rubble-mound/Single/Economics/ Accretion/Structural-design/Const-problems/Erosion/Long/High/ Short/Low/System/T-groins/Steel/Impermeable/1900-1949/ Maintenance

"Wave Action on Beaches" 4806GR0002
Jones, J. H., M. S. Thesis, June, 1948, Univ. of California, 24 pp., Unpublished. (GC211 .J77)

The purpose of this investigation was to study effects of groins on wave-induced longshore currents. Studies of the effects of several types

of groins on wave action, littoral sand transport, and underwater topography in the vicinity of each structure were made. The study was largely comparative, and only the relative changes effected by each type of groin were investigated.

"The Danish Westcoast: Littoral Drift Problems and Measures Against Coast Erosion" 5008GR0001
Bruun, P., The Dock and Harbour Authority, London, Vol. 31, No. 359, Sept., 1950, pp. 163-167.

Coastal protection structures, including groins, built on the west coast of Denmark are reviewed for the period from 1870 to 1950. The author gives an example of interest, noting that impermeable concrete-block groins have been sinking due to their great weight, and must be heightened periodically. Construction costs, structural design, and maintenance of structures are given.

1951. (V.F. 1091 series 14-6)

Effect of impermeable and permeable groins was determined by comparing topography of a straight, unobstructed beach in equilibrium with a beach that had reached equilibrium after a system of groins had been installed. Model tests showed that permeable groins retained from 11% to 26% of the sand used in the experiment; far less effective than for impermeable groins. Dye tests were employed to trace the pattern of littoral movement through permeable groins.

Anonymous, U. S. Army Beach Erosion Board Bulletin, Vol. 6, No. 1, Jan., 1952, pp. 3-6. (BEB Vol. 6, No. 1)

A model study was made of two types of groins: one, a sloping, impermeable groin; the second, a high, permeable groin. The investigation was designed to determine relative influence of the high permeable groins and the sloping impermeable groins for stabilizing a beach where littoral transport occurs. Among other conclusions it was found that permeable groins should not be used as individual units isolated along the beach, but rather in a system of groins.

"Measures Against Erosion at Groins and Jetties" 5210GR0001
Brunn, P., Proceedings of Third Conference on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1952, pp. 137-164. (TC203 .C6)

One problem on a coast with littoral transport is erosion on the downdrift side of groins and jetties. This paper deals with the problem giving special consideration to conditions on the Danish North Sea Coast where many interesting problems of littoral transport and coastal protection are found. These are discussed as an introduction to the main part of the paper which is principally concerned with downdrift erosion and measures for its prevention.

Rayner, A. C., Proceedings of Third Conference on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1952, pp. 209-216. (TC203 .C6)

Harbor bulkheads, beach bulkheads, and groins constructed of steel sheet piles were studied for more accurate estimates of the useful life based on rate of deterioration. Structures were located along the Atlantic Coast of the United States and the Gulf Coast of Florida. Mean rate of loss of thickness of sheet piles is given. It is shown that different types of structures and several parts of the same structure have different rates of loss.

Lee, C. E., Proceedings of Third Conference on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1952, pp. 331-343. (TC203 .C6) 5210GR0003

In the 117 years in which protective works have been applied to Presque Isle Peninsula there have been many types of structures and many methods of protection attempted. The large forces involved proved too great for vegetal growth alone to be effective in the porous material which forms the peninsula. Timber structures other than the rock-filled crib groins have had short life. Bulkheads exposed to the direct action of the waves have required frequent and expensive repairs. As demonstrated by the impoundment at the privately owned Kelso groin at the junction of the peninsula and the mainland, and at experimental groins, a spending beach gives best results. The problem is the method to be used in forming the beach.

Hardin, J. R., and Booth, W. H., Transactions of the American Society of Civil Engineers, Vol. 118, Paper No. 2535, 1953, pp. 39-50

The State of Illinois, acting through its Division of Waterways, has become increasingly concerned with the erosion problem of Lake Michigan. As a result, the state requested a cooperative beach erosion control study to determine the best plan of improvement for stabilizing the shoreline. This paper deals with condition of existing structures, state of erosion, and describes recommended protective measures.

"Experimental Groins, Camp Perry, Ohio" 5309GR0001
Anonymous, Sept., 1953, Unpublished Pictorial Report. (V.F. 618 9/22/53)

A photographic history, this report reviews the construction and progressive condition of a "mix-in-place" groin for a period of two months, and construction and condition of an "intrusion grouted rockfill" groin.

Key Words - Great Lakes/Field/Experimental/Structural-design/ Impermeable/Const-procedure/Rubble-mound/Misc-materials/1950-1954/Photographic/Single/

"Low Cost Shore Protection Used on the Great Lakes" 5310GR0001
Brater, E. F., Proceedings of Fourth Conference on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1953, pp. 214-226. (TC203 .C6)

This paper presents results of 3 years of field observations on low cost beach protection structures in use on the Great Lakes. Structures were studied in regard to their effectiveness as beach building and protective devices and with respect to their durability in resisting ice and wave forces. The term "low cost" refers to structures which cost between $10 and $30 per foot of frontage at 1952 prices.

"Principles of Shore Protection for the Great Lakes" 5310GR0002
Mason, M. A., Proceedings of Fourth Conference on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1953, pp. 207-213. (TC203 .C6)

The author states that a requirement of impermeability is absolute for groins built on shores of the Great Lakes. Because of the scarcity of natural shore sediment, permeable groins would be inadequate. The paper presents discussion of the coastal engineer's role and duty in shore protection.

Key Words - Great Lakes/Impermeable/

"Filling Pattern of the Fort Sheridan Groin System" 5310GR0003
Lee, C. E., Proceedings of Fourth Conf. on Coastal Engineering, Council on Wave Research of the Engineering Foundation, Oct., 1953, pp. 227-248. (TC203 .C6)

Analysis of the action of a groin system through the 14 months following construction is reported. Six surveys were made during this period which included onshore elevations to the bluff line and offshore soundings to about 7-foot depths. Wind records for investigation were studied, and hindcasts of wave conditions made. Analysis reveals that the cumulative volume of impoundment at the system may be expressed approximately. Tables of impoundment volumes are included as well as an energy index, and the relationship is discussed. Filling patterns of the system are recorded.

New Jersey"
Watts, G. M., U. S. Army Beach Erosion
Board Technical Memorandum, No. 77,
Feb., 1956, 33 pp.

Analysis of beach erosion at Ocean City, New Jersey, led to the conclusion that the most suitable plan of protection was artificial

placement of suitable sand on the shore and extension of seven existing stone groins. A study of the completed project revealed that loss of beach fill exceeded the estimated rate because: (1) fill sediment was finer-grained than the native sand; (2) shifting of inlet channels and bars caused extensive movement of beach material and; (3) the shoreline in the project area advanced relative to the adjacent shoreline to the southwest.

A series of fourteen timber groins were built at Grand Isle, Louisiana to control erosion. Erosion was not checked, and following Beach Erosion Board recommendations, hydraulic fill was introduced into the system. Preparation procedures are outlined, quantitative figures on sand loss and gain, and textural characteristics of the sand are given.

Nagai, S., Journal of Waterways and Harbors Division, ASCE, Vol. 82, No. WW4, Paper 1063, Sept., 1956, 13 pp. (TC305 .J3v.2)

It is an important and difficult problem to arrange groins effectively for protection against erosion by wave action on a sandy shore. This paper presents the relation of groin length, space, and orientation with respect to the shoreline, direction of wave propagation, and breaking point of the breakers. Relationship between wave steepness and sand transport, and some results of experiments concerning special types of groins are also presented.

Shimano, T., Hom-ma, M., Horikawa, K., Sakou, T., Proceedings of the Fourth Conference on Coastal Engineering in Japan, JSCE, 1957, pp. 111-121. (TC20d .C748)

This study examines the mechanism of beach deformation and provides criteria for the design of a groin. Functions of a groin are related to such factors as the characteristics of waves in the surf zone, sediment motion by waves and littoral currents, and eventual deformation of beach and nearshore topographies.

In building groins, the angle to the shoreline should be directed updrift, and the lengths should be adjusted so the tips will form a natural curve merging with the downcoast shoreline.

A section of coastline on the southern tip of India was subject to increasing amounts of erosion. A breakwater and an 11-element impermeable groin system were constructed as an experiment. Laboratory model experiments were also made. Observation of the structures in field and laboratory led to proposed advantageous construction of protective structures along other parts of shoreline where erosion was eminent.

Compression of wet or "running sand" can be produced by correctly designed groins, resulting in the stabilization of beaches. According to the authors, groins must be impermeable, substantial in construction so that they can withstand the longitudinal thrust of stabilized beach material, and high and long enough so that beach material will not be lost over or around them.

Jachowski, R. A., U. S. Army Beach Erosion Board Miscellaneous Paper, No. 2-59, Washington, D. C., May, 1959. (BEB M.P. 2-59)

Maryland north from Ocean City to Delaware has had a history of erosion over the past century. In 1954 and 1955 the Maryland State Roads Commission desired to stabilize this shore, and with limited funds available decided to experiment with sand-asphalt construction for a groin system. Construction procedure, the behavior of the beach and groins are discussed; illustrative and photographic coverage included. Subsequent surveys showed that the groins were repeatedly undermined and settled or were destroyed. Net effect of the entire groin system at the end of 3 years was negligible.

"Laboratory Study of the Effect of Groins on the Rate of Littoral Transport: Equipment Development and Initial Tests" 5906GR0001
Savage, R. P., U. S. Army Beach Erosion Board Technical Memorandum, No. 114, June, 1959, 56 pp.

Waves were generated to impinge obliquely on a sand beach in an outdoor wave test basin. Longshore movement of sand due to wave action, with and without groins, was measured. Procedures and equipment for trapping, measuring and transporting entrapped sand to the updrift end of the beach are described. Test results, such as cumulative weight of sand movement relative to test duration, relative weight of sand trapped in different profile zones and physical changes to profile and bottom contours, are graphically presented. Rate of sand movement relative to applied wave energy is compared with values obtained by other investigators. Rates determined from small-scale laboratory data fall below an extrapolated curve derived from data from field tests. No positive conclusions are drawn; further testing is underway.

"Coast Erosion and Defence" 6000GR0001
Russell, R. C. H., Department of Scientific and Industrial Research Hydraulics

Research Station, London, Hydraulics Research Paper, No. 3, 1960, 14 pp. (TC1 .G7p No. 3)

Among nine questions and answers on coast erosion and defense, these are especially pertinent to groins: (1) how should the designer decide whether or not groins are desirable in a particular case, and how should he decide on the spacing, length, height, profile, and orientation? (2) what are the relative merits of permeable and impermeable groins? (3) what causes lee side scour, and how should the problem be dealt with by the designer of sea defenses?

"The Development of Coastal Profiles on a Receding Coast Protected by Groynes" 6008GR0002
Sorensen, T., Proceedings of the Seventh Conference on Coastal Engineering, ASCE, Aug., 1960, Vol. 2, pp. 836-846. (TC203 .C6)

This paper analyzes the longshore sand transport by waves and currents on natural coasts outside the breaker zone. A tentative expression for the transport capacity is established and applied to the problem of the effect of groins on the development of the coast profiles. It is shown that results are consistent with observed development of the Danish North Sea Coast at Thyboron, which has been protected by groins and closely observed for 60 years.

"Shoreline Advancement by Sea Wall and Groynes at Cochin" 6008GR0003
Hiranandani, M. G., and Gole, C. V., Proceedings of the Seventh Conference on Coastal Engineering, Vol. 2, Aug., 1960, pp. 860-871. (TC203 .C6)

This report on the groins and seawall at Cochin, India, presents the following conclusions: (i) Groins 200 feet long are to be preferred to groins 150 feet long. (ii) Spacing between groins should not exceed three times the groin length. (iii) Heavy stones, used as seawall armor on a core of smaller stones, result in decreased rate of maintenance. (iv) Piles at toe of seawall do not give extra protection

to the seawall. (v) Inclined groins do not commend themselves for adoption on this coast.

MacKinnon, R. B., and Hannon, J. R., Shore and Beach, American Shore and Beach Preservation Assoc., Vol. 28, No. 2, Oct., 1960, pp. 37-38. (TC330 .Am3)

Spur groins constructed normal to jetties on the updrift side near the low water line were successful in stopping scour along the jetties. In a short time, the foreshore built out to where the spur was placed. Author points out these groins may not be a solution for all similar instances.

"Behavior of Beach Fill and Borrow Area at Prospect Beach, West Haven, Connecticut" 6108GR0001
Vesper, W. H., U. S. Army, Beach Erosion Board Technical Memorandum, No. 127, Aug., 1961, 29 pp.

Comparative survey and sample data are analyzed to determine behavior of beach fill obtained from an offshore borrow source. A groin system and feeder beach were also included in the project. The project has provided a protective beach over a 3-year period equal to or greater than minimum dimensions required. Average annual losses have been about 13,000 cubic yards per year, and the feeder beach has performed satisfactorily. Size and sorting characteristics of the fill material are shown to have been suitable, using Krumbein's method of computed composite curves. Borrow sources, although only 1,000 feet offshore, were suitable for local wave conditions, and shoaling thereof has been limited to silty material. Annual costs have been about $3.00 per linear foot of shore protected. The groins are effective and have probably reduced fill losses to a degree justifying their construction.

"The Selsey Coast Protection Scheme" 6112GR0001
Duvivier, J., Journal of the Institution of Civil Engineers, London, Vol. 20, Dec., 1961, pp. 481-506. (TC257 .D2)

Because of threatening erosion or inundation or both, a scheme was undertaken to construct protective structures, including groins, on the coast east and west of Selsey Bill, England. This paper gives the history of erosion, trends of littoral transport and currents, sediment supply sources, scheme of protective works, and results after construction.

A new type of articulated groin built with transverse and longitudinal flexibility is discussed, and its satisfactory performance noted. Measures taken to combat erosion beyond the terminal groin are presented.

Relationship between high water lines, groin spacing, and profile of a groin system is demonstrated experimentally. The results of this procedure were used in the construction of a groin system on the Norfolk coast, England.

This article suggests that design criteria for groin systems can be determined through experimental analysis. The design of a groin system should be carried out in two operations, that relating to the spacing and location upon the plan, and that relating to the shape and levels of the profile.

"A Model Study of the Behavior of Beaches and Groynes" 6206GR0001
Kemp, P. H., Journal of the Institution of Civil Engineers, London, Vol. 22, 1962, pp. 191-210. (TC535 .K4)

This paper reviews factors which influence the shape of the natural shoreline in the absence of groins. A series of model experiments is then described; three types of impermeable groins were subjected to a cycle of accretion, depletion, and recovery, under the action of waves of different characteristics. Attention is drawn to the effect of the alignment and type of groin on the rate of longshore transport, littoral currents, scour, and shoreline orientation. Each arrangement of the groins is seen to possess characteristic advantages and disadvantages which can influence the choice of groin and its alignment in given circumstances. Within the limitations of the groin experiments it would seem that the shoreline orientation and rate of longshore transport can be varied by modifications to groin type and alignment. Shoreline reorientation can reduce the littoral current and consequently reduce the scour. By an appropriate choice of groin type and alignment, it should be possible to orient the shoreline in such a way that the effects of storm attack are reduced.

Kinmont, A., U. S. Army Beach Erosion Board Bulletin, Vol. 16, July, 1962, pp. 22-23. (BEB Vol. 16)

The impermeability of groins at Durbin, South Africa, have caused sand at their ends to be eroded. Due to an increase of water depth at their ends, the normal gradients of the beach have been disturbed. Instead of accumulating on the southern face of the groin - the littoral transport being northerly - the sand is forming a central spit, while the areas on both sides of the groins are being severely eroded.

"Structures for Shore Protection" 6307GR0003
Hall, J. V., Civil Engineering, ASCE, Vol. 33, No. 7, July, 1963, pp. 38-41.

The most widely used and the best solution to the beach erosion problem is the artificially constructed and nourished beach. Groins are the most important structures for enlargement and stabilization of beaches.

Key Words - Permeable/Impermeable/Low/High/System/Artificial-fill/

"Coastal Protection for Florida" 6310GR0001
Bruun, P., and Manohar, M., Engineering Progress at the University of Florida, Bulletin Series No. 113, Vol. 17, No. 8, Aug., 1963, Engineering and Industrial Experiment Station, Gainesville, 56 pp. (TC203 .F62 v. 17)

Extensive coverage is given to protective structures constructed along the Florida coast. Design criteria of groins are discussed including length, spacing, height, and permeability. Charts summarize types of shore protection structures as a function of specific beach conditions.

Key Words - Accretion/Erosion/S. Atlantic/Artificial-fill/System/Permeable/Impermeable/Adjustable/Low/Misc-plan/Europe/Timber/Rubble-mound/Structural-design/Asphalt/T-groins/Scour/Piling/Z-groins/

"Stability of Beaches Using Groins" Ishihara, T., and Sawaragi, T., Proceedings of Ninth Conference on Coastal Engineering, ASCE, June, 1964, pp. 299-303. 6406GR0001

The authors conducted a field investigation on the stability of beaches, using groins along the Imazu and Sakano Coasts in Tokushima, Japan. Based on the survey of coastal configuration between groins and on the estimation of the amount of littoral drift in the case of no structure, the storage capacity of permeable and impermeable groins was determined. It was found that the groins have to be designed in types, lengths and intervals so that equal amounts of littoral transport along the coast may be secured. Conclusions are presented.

"Variations in Groin Design" 6510GR0001
Berg, D. W., and Watts, G. M., Coastal Engineering Santa Barbara Specialty Conference, ASCE, Oct., 1965, pp. 763-797. (TC203 .C9S6)

Considering all types of structures used for shore protection purposes, the groin is probably the most widely used and yet it is perhaps the one structure least understood. Groins or groin systems of a particular design may be found where the intended purpose was achieved; however, it is not uncommon to learn of other cases where a similar design was used and negligible benefits resulted. The purpose of this paper is to point out pertinent features of basic types of groins and to illustrate some of the many variations which have been built in the United States.

"Use of Long Groins as Artificial Headlands" 6510GR0002
Dunham, J. W., Coastal Engineering Santa Barbara Specialty Conference, ASCE, Oct., 1965, pp. 755-762. (TC203 .C9S6)

The construction of short groins to trap fillets of sand along coastal beaches characterized by prevailing littoral transport has become a well known practive in coastal engineering. Less common, but often equally important, is the use of long groins to form artificial headlands which trap sand more or less permanently in artificial pocket beaches. The successful use of this long-groin technique at

three Southern California beaches is described, the need for more research as to the effectiveness of such structures is suggested, and other possible uses of long groins are discussed.

"Groins and Effects - Minimizing Liabilities" 6510GR0003
Lillivang, O. J., Coastal Engineering Santa Barbara Specialty Conference, ASCE, Oct., 1965 pp. 749-754. (TC203 .C9S6)

Groins produce various effects on different shorelines; design data are sparse, so experience and judgment become important design skills to a greater degree than in most engineering problems. Court decisions are described which, from the engineering standpoint, seem opposite in effect where physical conditions were similar. The conclusion is made that the engineer who undertakes projects including seacoast groins needs legal counsel, special engineering knowledge and experience, and a healthy respect for the continuing acceptability of the client's seacoast groins to neighboring proprietors.

Key Words - Legal/California/Erosion/

"Littoral Processes and the Development of Shorelines" 6510GR0004
Inman, D. L., and Frautschy, J. D., Coastal Engineering Santa Barbara Specialty Conference, ASCE, Oct., 1965, pp. 511-536. (TC203 .C9S6)

Basic principles bearing on the nature of beaches and processes that act to modify them are considered in light of present coastal development demands. A working hypothesis is developed that applies the principle of the conservation of mass to the mechanics of granular-fluid media. This hypothesis appears to have general application to sand transport processes in the littoral zone. Additional research must be done to provide basic information in some critical areas before application can be made with assurance.

"Study of Erosion Along Homer Spit and Vicinity, Kachemak Bay, Alaska" 6511GR0001

Gronewald, G. J., and Duncan, W. W.,
Coastal Engineering Santa Barbara
Specialty Conference, ASCE, Oct., 1965,
pp. 573-682. (TC203 .C9S6)

This is a progress report on the Homer Spit Beach Erosion Study. Information is presented regarding the rapid acceleration of the erosion processes due to the subsidence of Homer Spit during the 27 March 1964 earthquake. The effect on existing groins both before and after the quake are discussed. Immediately after the quake, emergency measures were required to prevent wave and high water damage to existing structures on the spit. An evaluation of the effectiveness of these measures is presented along with basic data gathered from the study and some of the problems encountered.

"The Dynamics of a Coast with a Groyne System" 6809GR0001
Bakker, W. T., Proceedings of Eleventh Conference on Coastal Engineering, ASCE, Vol. 1, Sept., 1968, pp. 492-517.
(TC203 .C6)

A mathematical theory is presented about phenomena which occur when groins are constructed. In this theory the coast is schematized by two lines; one represents the beach, and the other the inshore. Theory is based upon the following: (1) littoral transport is a linear dependent of the angle of wave incidence, and (2) sand transport perpendicular to the coast depends on the steepness of the profile.

It was found that the influence of a groin system is threefold: (1) it reflects short-period beach processes on the adjacent areas, (2) retards erosion, and (3) gives lee-side scour.

"The Effect of Groynes on Stable Beaches" 6809GR0002
Price, W. A., and Tomlinson, K. W., Proceedings of Eleventh Conference on Coastal Engineering, ASCE, Vol. 1, 1968, pp. 518-525. (TC203 .C6)

Tests were carried out in a wave basin to study the effect of groins on a beach that was stable for a particular wave climate and a given supply of littoral material. The main result showed that on the part of the beach between H.W. and L.W. level the groins produced no buildup. The only buildup that occurred took place seaward of the impermeable groins. Permeable groins had little effect either inshore or offshore.

"Experimental Study of the Hydraulic Behavior of Groyne Systems" 6809GR0003
Barcelo, J. P., Proceedings of Eleventh Conference on Coastal Engineering, ASCE, Vol. 1, Sept., 1968, pp. 526-548. (TC203 .C6)

Results of an experimental study of the hydraulic behavior of groin systems are described. Characteristics of the evolution of beach stretches between groins under action of waves with different obliquity, heights and periods are defined. Results obtained are intended for design of systems of functional groins which secure an adequate partition of the beach in satisfactory hydraulic conditions, and also meeting use requirements, notably from the architectural and recreation standpoints. The author briefly discusses longshore transport, and presents some experimental conclusions on the relations between longshore drift and the characteristics of the waves.

Ridehalgh, H., Proceedings of Eleventh Conference on Coastal Engineering, ASCE, Vol. 2, Sept., 1968, pp. 1258-1266. (TC203 .C6)

This paper describes works to improve and stabilize the Dubai Creek entrance located on the Arabian Gulf Coast. As part of the project a groin (jetty) was constructed to protect the entrance and to encourage accretion. Maps show accretion as the different phases of the project are completed.

"A Mathematical Theory about Sand Waves and Its Application on the Dutch Wadden Isle of Vlieland" 6810GR0001
Bakker, W. T., Shore and Beach, American Shore and Beach Preservation Assoc., Vol. 36, No. 2, Oct., 1968, pp. 5-14.

A mathematical theory for predicting sand wave formation was tested in the field, and showed that groins totally reflect the sand wave. The amplitude of the accretion and erosion at the spot of the first groin becomes twice the accretion and erosion where no groins had been constructed.

"Report to the Twenty-second International Navigation Congress" 6900GR0001
Bijker, E. W., and Svasek, J. N., Twenty-second International Navigation Congress, Permanent International Association of Navigation Congresses, Sec. II, 1969, pp. 181-202. (TC5 .InBr)

This is an extensive research paper covering such aspects as theoretical and statistical analysis of longshore transport behavior of sediment movement, sediment balances, and determination of wave and current scale models. The influence of morphological mechanisms is outlined. Though groins are not explicitly discussed, structures are discussed which act similar to groins.

A groin system was built along sand-spits to reinforce the spits and to check their end growth. Initially, artificial-fill was introduced into the system. The effects are presented in this paper.

"Colored-sand Tests with Luminescent Sand Groin Fields" 7000GR0001
Kolp, O., Petermanns Geographische Mitteilungen, Vol. 114, 1970. Translated. (GB454 .B3 K29)

The objectives of this investigation were: (1) the exploration of an approach that could be followed in later studies and which would be centered around the execution of colored-sand experiments; (2) to give a zonal breakdown of relief, flow field, sediment movement, and colored-sand distribution, and their modification by groins on various charts, and (3) to evaluate the effectiveness of various types of groins and to compare the hydrographic conditions existing in the shore areas of sections of coast with and without groins.

Bakker, W. T., and Joustra, D. Sj.,
Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Vol. 2, Sept., 1970, pp. 709-728. (TC203 .C6)

An investigation of the influence of groins concluded that the erosion of areas with groins was much less than erosion of adjacent areas. This effect is due partly to lee-side scour, but mainly to decreased erosion in the protected area.

"Experimental Study of the Hydraulic Behavior of Inclined Groyne Systems" 7009GR0003
Barcelo, J. P., Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Vol. 2, Sept., 1970, pp. 1021-1040. (TC203 .C6)

This paper presents the results of an experimental study on the behavior of inclined groins and a short discussion on the improvement of groin systems. It supplements a paper presented at the Eleventh Coastal Engineering Conference (London, 1968). In the present paper both studies are applied to the design of a groin system located to the south of the Tagus estuary (near Lisbon), where serious erosion has taken place.

Key Words - Transport-normal/System/Misc-plan/Accretion/Erosion/ T-groins/Europe/Experimental/1900-1949/1955-1959/1960-1964/1965-1969/Impermeable/

"The Effect of Groynes on Eroded Beaches" 7009GR0005
Price, W. A., and Tomlinson, K. W., Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Vol. 2, Sept., 1970, pp. 1053-1059. (TC203 .C6)

Effect of impermeable groins on an eroded beach was studied in a laboratory. A beach was allowed to reach equilibrium for a particular wave climate and supply of littoral material. The foreshore was then manually eroded, and the beach allowed to return to equilibrium with and without groins. It was found that the presence of groins increased the rate of accretion but did not significantly build up the inshore beach beyond the stable levels. Bed levels seaward of the groins were increased.

Key Words - Impermeable/Accretion/Erosion/Experimental/System/Europe/

"Characteristics of Shingle Beaches: the Solution to some Practical Problems" 7009GR0006
Wood, A. M. M., Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Vol. 2, Sept., 1970, pp. 1059-1075. (TC203 .C6)

Shingle beaches differ from sand beaches mainly in the mode of transport of the material and in the permeability of the beach. The typical beach forms are in consequence different and the typical problems of beach stabilization require different solutions.

The mechanism of littoral transport of shingle is controlled predominantly by the action of the breaking wave; on a groined beach a simple theory is advanced to relate transport to groin length and spacing.

Key Words - System/High/Theory/Field/Misc-plan/Long/Piling/ Steel/Concrete/Timber/Europe/

"Variation of Topography of Sea-Bed Caused by the Construction of Breakwaters" 7009GR0007
Sato, S., and Irie, I., Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Sept., 1970, pp. 1301-1319. (TC203 .C6)

Changes of the topography of sea-bed caused by the construction of jetties and breakwaters are discussed on the basis of charts of several Japanese ports and the results of model tests.

Key Words - Asia/Field/Model/Experimental/

"The Dynamics of a Coast with a Groyne System" 7009GR0008
Bakker, W. T., Breteler, E. H. J. K., Roos, A., Proceedings of the Twelfth Coastal Engineering Conference, ASCE, Vol. 2, Sept., 1970, pp. 1001-1020. (TC203 .C6)

Mathematical coastal model is schematized by a beach line and an inshore line (two-line theory). Two aspects of the effects of a groin system are covered: (1) Prevention of littoral transport in area between shoreline and groin head, and (2) formation of a sheltered area at lee-side of groin, caused by diffraction.

Key Words - Theory/System/Model/Accretion/Erosion/Impermeable/

"Beach Behavior, North Shore, Long Island Sound" 7011GR0001
McCabe, R. A., Journal of Waterways, Harbors and Coastal Engineering Division, ASCE, Vol. 96, No. WW4, Paper No. 7679, Nov., 1970, pp. 781-794.

A groin system constructed and evaluated on White Sand Beach has shown: (1) necessary depth of the updrift flank of a groin depends on minimum sand cover on that side of the groin, and can be independent of the downdrift depth; (2) maximum width of the resulting stable beach is limited by capacity of a shorter groin at the end and the amount of sand available; (3) groin construction does not cause recession of an adjacent beach if that beach was already in its natural orientation, and (4) a groin is filled to capacity when it spills sand between the beach toe and the limit of normal wave uprush - in this study above about 2 feet higher than M.H.W.

Key Words - N. Atlantic/Rubble-mound/Structural-design/Misc-plan/ System/

"Experiment in Shore Protection" 7105GR0001
Riese, R. C., The Military Engineer, Society of American Military Engineers, Vol. 63, No. 413, May-June, 1971, pp. 181-182.

Lt. Colonel Riese from the Los Angeles District, U. S. Army Corps of Engineers, has outlined the Coastal Engineering Research Center's experimental groin project at Point Mugu, California. The project is designed to determine the influence, under different conditions of height, length, and permeability, the quantitative movement of sand over, around, and through a groin.

DEFINITIONS OF KEY WORDS

Accretion: Artificial aggradation where a buildup of the beach occurs by an act of man; in this case by groin construction.

Adjustable: Groins in which height and permeability may be altered.

Africa: Refers to the shoreline of Africa.

Alaska: Refers to the shoreline of Alaska.

Artificial-fill: The process of replenishing a beach by artificial means.

Asia: Refers to any shoreline of the Asian Continent, Japan, Indian Subcontinent, and the eastern shore of the Mediterranean Sea.

Asphalt: Denotes that the groins are built in part or wholly of asphalt.

Australia: Refers to the shoreline of Australia.

Budd: Groin of Budd design.

California: Refers to the shoreline of California.

Case: Groin of Case design.

Central America: Refers to the shores of Central America.

Concrete: Denotes that the groins are built in part or wholly of concrete.

Const-problems: Any problems encountered during groin construction or as a result of faulty construction.

Const-procedure: Construction process and method.

Corner-groins: A type of groin which is built on the line that bisects the angle between the beach and a groin.

Du-Plat-Taylor: Groins of Du-Plat-Taylor design.

Economics: Actual, appropriated, or projected costs of groin construction and maintenance.

Erosion: Refers to shore erosion prior to or as a result of groin construction.

Europe: Refers to the shoreline of all European countries bordering the Atlantic Ocean, North Sea, Baltic Sea, and northern shore of the Mediterranean Sea.

Experimental: Reports which discuss experimental studies on groins either in the field or laboratory.

Field: Actual in-the-field studies as opposed to laboratory studies.

Geometric-shapes: Any material used to construct a groin or a component section of a groin that has geometric regularity, e.g. cellular groin, tetrapods.

Great Lakes: Refers to the shoreline of the Great Lakes.

Haupt: Groin of Haupt design.

Hawaiian Islands: Refers to the shores of the Hawaiian Islands.

High: Groins which are of sufficient height as to impede the passage of littoral drift and overtopping of waves at high tide.

House Document: Refers to U. S. Congress House of Representatives' Reports which contain pertinent data on groins.

Impermeable: Groins which prevent littoral drift from passing through the structure.

Legal: Any legal aspects concerning the construction of groins.

Long: A groin whose length extends beyond the breaker zone.

Low: Groins which do not exceed high tide level, and which allow passage of appreciable quantities of littoral drift by overtopping waves.

L-groins: Groins built in the shape of an "L".

Maintenance: Repair or additional construction of groins.

Milliken: Groin of Milliken design.

Misc-materials: Materials that groins may be constructed of other than the materials listed in the Key Word List.

Misc-plan: A plan view or description of the plan view of the alignment of a single groin or of a groin system with the beach, and the spacing of groins in a system.

Mobbs: Groin of Mobbs design.

Model: Pertains to laboratory investigations of groins by model studies.

Not Annotated: Articles which have not been annotated.

Notched: Groin with the entire length notched at the top providing increased permeability.

N. Atlantic: Refers to the shoreline of the United States from Maine to the Virginia-North Carolina state line.

N. Pacific: The shoreline of northwestern North America from Alaska south to the Oregon-California state line.

Patent: Articles which present groin patents.

Permeable: Groins which (have openings through the structure of sufficient size to) permit passage of appreciable quantities of littoral drift.

Photographic: Articles which present extensive photographic coverage of groins.

Piling: Denotes that the groin is built in part by piles.

Rubble-mound: Groins constructed in part or wholly of stone.

Scour: Removal of underwater material by waves and currents at the base or toe of a groin.

Shoaling: Deposition of underwater material in the vicinity of a groin as a result of decrease in the efficiency of wave and current capacity as caused by groins.

Short: A groin whose length does not extend beyond the breaker zone.

Single: Refers to a single groin.

Spur: A groin-type structure connected to the flank of a groin and normal to it.

Steel: Refers to groins constructed in part or totally of steel.

Structural-design: Design of a groin or system of groins.

System: A series of groins acting together to protect a long section of shoreline.

S. Atlantic: Refers to the shoreline of the United States from the Virginia-North Carolina state line to the tip of the Florida peninsula.

S. M. Wood: Groin of Sydney M. Wood design.

Terminal: The last groin on the updrift end of a groin system.

Texas Gulf: Refers to the shoreline of the Gulf of Mexico from the tip of the Florida peninsula to the Yucatan Peninsula.

Theory: Refers to articles presenting groin designs based upon mathematical formulae, model studies, and personal experience.

Timber: Groins constructed in part or wholly of wood products.

Transport-normal: Movement of beach and near shore material in a vector direction approximately normal to the shoreline.

T-groins: Groins built in the shape of a "T", ie. a groin with a breakwater at its seaward end.

Wosenitz: Groin of Wosenitz design.

Z-groins: A type of groin with one or more marked angular directional changes along its length as seen in plan view.

1800-1900
1900-1949
1950-1954
1955-1959 Inclusive dates denoting construction and survey dates
1960-1964 of groin projects.
1965-1969
1970-1974

13. ABSTRACT

A groin is a shore protective structure built (usually perpendicular to the shore) to trap sedimentary material or to retard erosion of the shore. Of all the shore protective structures used by coastal engineers, the groin is the most difficult to design - functionally and structurally. Because this complexity of design was not recognized until recently, many early groin installations were failures. CERC supports a continuing research program devoted to gaining a better understanding of groins. This bibliography evolved from the groin research program.

About 460 articles published since 1900 on groins and groin-type structures are presented in this bibliography. Annotations accompany each bibliographic entry where possible. Indexes of authors, titles, and subjects are included to aid the researcher. Unavailable literature such as foreign articles, although not annotated, are included as entries in both the annotated section and the indexes.
